

# IPv6

## The Next Internet Protocol

# IPv4

- It has served the Internet community well with virtually no change for over 20 years
- The connectionless service model upon which it is based has proven to be simple, robust and adaptable to a wide variety of application layer services
- Its primary shortcoming is its address space which is proving to be inadequate in a world that now wants to base everything on IP
- The address space must be enlarged to avoid a future Y2K style panic

## IPv6, The Next Generation

“If it isn’t broken don’t fix it”

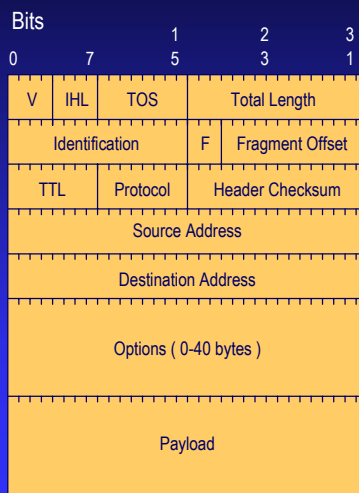

- IPv6 increases the address space dramatically without changing the basic nature of IPv4’s operation
- IPv6 does fine tuning rather than wholesale change of IPv4 features
- IPv6 adds some new features which reflect the current reality of Internet usage
- IPv6 aims to ease the process of transition which is expected to take several years

## New Address Space

- 128-bit address space
  - $2^{128}$  possible addresses
  - 340,282,366,920,938,463,463,374,607,431,768,211,456 addresses ( $3.4 \times 10^{38}$ )
  - This is more than  $10^{20}$  addresses for each square inch of the earth's surface

© Copyright Infotel Systems Corp

## Address Changes

- IPv6 uses multicast addresses in place of less bandwidth efficient broadcast addresses
- IPv6 introduces site local and link local addresses to replace IPv4 private addresses
- IPv6 adds a new form of address called "anycast", to find network resources efficiently
- IPv6 uses address prefixes to replace address classes and reduce router table size

## Protocol Fine Tuning

### Protocol enhancements include:

- The ability to support options of any length (IPv4 has a 40 byte option limit)
- The elimination of the IP header checksum which is redundant due to layer 2 hardware checksums
- The elimination of fragmentation by routers to improve router throughput
- The introduction of a jumbo packet option for high speed, low bit error rate networks

© Copyright Intel Systems Corp

## New Features

### IPv6 adds some new features:

- IPv6 adds security options to protect against some of the more common Internet attacks
  - Address spoofing
  - Wire Tapping (active and passive)
  - Replay
  - Traffic analysis
- Ipv6 adds mobility support to reflect the popularity of wireless communications

© Copyright Intel Systems Corp

## New Features cont.

### IPv6 adds some new features:

- IPv6 adds a flow label to support connection oriented features
  - MPLS has shown the value of connection oriented service for quality of service and traffic management
- IPv6 adds stateless address configuration to simplify address management

## Transition Options

- The transition from IPv4 to IPv6 is expected to take many years
- During the transition period IPv4-IPv6 coexistence and interoperability will be extremely important
- IPv6 coexistence and interoperability options include:
  - Tunneling
  - Dual stack hosts and routers
  - DNS support
  - Transport and application layer proxies

## Router to Router Tunneling

- Router to router tunneling allows IPv6 subnets to be connected across an IPv4 network
- Hosts do not need to support tunneling with this method
- Router manufacturers (e.g. Cisco) support several types of router to router tunnels

© Copyright Infotel Systems Corp

## Host to Router Tunnels

- Host to router tunnels can be used to connect a remote host on an IPv4 network to hosts on an IPv6 network
- 6 over 4 (RFC 2529) and 6 to 4 (RFC 3056) are two tunneling techniques that can accomplish this

© Copyright Infotel Systems Corp

## Host to Host Tunnels

- IPv6 hosts can be connected over an IPv4 network using host to host tunnels
- 6 over 4 tunneling is one such mechanism

## 6over4 Tunneled Packet

V	IHL	TOS	Total Length	
Identification			F	Fragment Offset
TTL		41	Header Checksum	
131.107.210.52				
131.107.210.49				
V	Class		Flow Label	
Payload Length			Next Hdr	Hop Limit
FE80::836B:D234				
FE80::836B:D231				
Payload				

Field	Value
IPv6 Source Address	FE80::836B:D234
IPv6 Destination Address	FE80::836B:D231
IPv4 Source Address	131.107.210.52
IPv4 Destination Address	131.107.210.49

- IPv4 Protocol field is set to 41 indicating an IPv6 packet
- Note that the last 4 bytes of the IPv6 addresses are hexadecimal representations of the IPv4 addresses

## Windows® Portproxy

- TCP relay service on Win XP and Server 2003 for:
  - IPv4 to IPv6
    - IPv4-only host can communicate with IPv6-only server or application
  - IPv6 to IPv4
    - IPv4-only host can communicate with IPv6-only server or application
- Use to “IPv6-enable” IPv4-only applications running on a Windows.NET Server computer

© Copyright Infotel Systems Corp

## Portproxy Example

Step 1	Host performs DNS lookup on Server URL
Step 2	DNS server returns IPv4 address of IPv4/IPv6 host
Step 3	Host sets up TCP connection to IPv4/IPv6 host (port 80)
Step 4	IPv4/IPv6 host sets up TCP connection to server using IPv6 address (port 80)

## DNS Support

© Copyright Infotel Systems Corp

## Summary

- The transition to IPv6 is not a question of if but of when
- All major vendors now support IPv6 in some way
- Planning ahead will avoid a Y2K style panic as the IPv4 address space exhausts
- Enterprises should consider implementing some form of IPv6 pilot project to gain experience with the new address formats and operational features
